S项目小结

业务

2022.4.25 入职,主要负责 B端【商品中心】和【红人营销】前端迭代和维护。

在商品中心,完成了整体能力建设:

- 1. 基础能力: 围绕商品底层结构/核心发布及上下架流程,接入麦哲伦商品中台,实现对商品数据的统一管理,为 C端商城 提供必要的数据来源:
 - a. 完成商品信息往 skc 层级下放,更精细管理商品数据字段;
 - b. 销售库存实现全站共享+虚仓,保证库存信息正确,提升了售卖机会,减少超卖
 - c. 接入标签库、摄影套图、板房商品尺码等,解藕常变数据,方便运营配置;
- 2. 业务支持: 支持快速扩展国家、店铺渠道; 支持不同模式商品运营; 快速扩展商品品类; 便于业务快速扩张:
 - a. 支持主商品到站点商品运营,支持独立站商品和 Shopify、TTS、TTF等不同渠道商品运营,实现一品发多站的高效商品管理目标;
 - b. 针对OBM新业务模式,协同供应商管理系统搭建商品品牌库,并打通C端展示链路,实现S的OBM商品品牌规范管理及应用;
 - c. 新开欧洲7个国家支持独立站;支持TTF商品侧沙特开国;
- 3. 交互体验: 优化交互体验; 增加批量操作, 提升运营效率:
 - a. PLM系统上线后,打通了PLM到商品的推送链路,商品主数据直接读取PLM,减少信息录入成本,业务粗估由1人日创建25款 提升到1人日可创建70款,效率提升150%+;
 - b. 支持商品各环节打回PLM,减少线下沟通成本;协同业务对齐和摄影分工,支持商品创建活动图灵活管理,减少非必要流程;
 - c. 完成批量上下架、excel批量导入导出、批量审核、PLM产品批量上架排期、商品更新前后便捷对比、批量更新多个站点信息、长宽高打通WMS减少输入项、标题配置规则自动生成并引入算法自动生成、UED专项迭代30+优化点等多项批量及效率提升功能;

数据:目前已建设一级类目19,叶子类目476,属性200+,属性值2000+,商标近100,已完成TTS/自建站/Shopify3个渠道、17个站点的商品统一管理,已支持业务发布主商品7700+,站点商品7.7w。

在支持沙特上线项目,月上架数2000+,月新增品类100+。

技术

S项目B端由很多子应用构成,目前已有十来个,对于项目的规范和基建支持很有需要。

参与技术项目:

- 1. BFF 建设:

 - b. 搭建 guluS 插件脚手架,统一代码规范、类型支持、构建发包。降低开发负担,提高插件保障度。 ② guluS-脚手架
 - c. 开发维护 guluS 透传插件,减少繁琐的 rpc 接口透传处理,为 wms 多端系统快速适配自定义路由前缀,支持透传接口耗时记录。
 - https://bnpm.bytedance.net/package/@gulu-s/plugin-rpc-forward
 - d. 开发维护 response 处理插件,规范 BFF 返回结构。 https://bnpm.bytedance.net/package/@gulu-s/plugin-response

- e. 参与 plm 以图搜图开发;完成 mysql 接入、设计、监控告警等流程;完成 BFF 定时任务建设。
- 2. arcoS 组件库建设:
 - a. 完善组件脚手架,统一代码规范、单测覆盖、构建发包,规范化版本管理,接入 ci/cd 自动化发包。降低开发负担,提高开发效率。
 - 国[WIP]构建发布自动化、国单测接入、国存量组件统一规范
- 3. 研发规范建设:
 - a. 开发 eslint 插件,覆盖团队前端项目、组件库项目,统一代码规范。 **Elint** 使用介绍及插件开发指南 、https://bnpm.bytedance.net/package/@s-fe/eslint-plugin
 - b. 调研 mock 方案,提供开发效率。
 - Mock 指北
 - c. 接入飞书机器人,服务后端通过 goofy stack 接入 gulu NodeJS,方便后续搭建自动化通知,自动化报表能力。 S-FE robot、goofy stack
 - d. 调研并推动团队接入火车发布
 - **ES供应链前端接入火车发布**

代码示例

前端很多自动化的工作都能基于目录结构

1. 在前端项目中,webpack 提供了 api requie.context ,能够在编译阶段获取目录信息。对于B端系统,一个简单的使用场景,是通过目录结构,自动化生成路由配置,菜单栏配置,以及对路由和菜单权限的绑定。以下是获取目录结构的一个小例子

```
mport {
 1
      RouteProps,
 3
      useLocation,
      matchPath,
 4
    } from '@jupiter/plugin-runtime/router';
 5
 7
    export interface IRoute extends RouteProps {
      [key: string]: any;
      path: string; // 路由地址
9
      redirect?: string; // 重定向
10
      routes?: IRoute[]; // 子路由
11
      layout?: React.ReactNode; // 路由组件包裹层
12
      hideSideMenu?: boolean; // 是否隐藏 SideMenuBar
13
      showProductMenu?: boolean; // 是否展示产品菜单
14
      componentProps?: Record<string, any>; // 组件 props
15
16
17
18
     * 判断是否是路由配置
19
     * @param val
20
      * @returns boolean
21
22
23
    const isRoute = (val: any): val is IRoute => typeof val?.path === 'string';
24
25
      * 过滤正确的路由配置
26
27
      * @param val
28
      * @param res
     * @returns IRoute[]
29
30
    const filterRoute = (val: any, res: IRoute[] = []) => {
31
      if (isRoute(val)) {
32
```

```
33
        res.push(val);
      } else if (Array.isArray(val)) {
34
        val.forEach(itm => filterRoute(itm, res));
35
36
37
38
      return res;
39
    };
40
41
      * 检索 @/router 目录下所有路由配置,即从所有 index.ts 文件里获取路由配置
42
43
     const genRoutes = () => {
44
      let res: IRoute[] = [];
45
      const r = require.context('./', true, /index\.ts$/);
46
       r.keys().forEach(key => {
47
        // 排除此文件
48
        if (key !== './index.ts') {
49
          const vals = Object.values(r(key));
50
          res = res.concat(filterRoute(vals));
51
        }
52
53
      });
54
55
      return res;
56
57
     // 路由汇总
58
    const allRoutes = genRoutes();
59
    export default allRoutes;
60
61
62
      * 通过 Location 获取当前 current route
63
     * @returns Iroute
64
65
      */
    export const useGetRoute = () => {
66
      const { pathname } = useLocation();
67
68
      const tmp = [...allRoutes];
      const recur = (arr: IRoute[]) => {
69
        for (const itm of arr) {
70
          if (matchPath(pathname, itm)) {
71
72
            return itm;
73
          }
74
          // 拼接到数组后面,直至遍历所有 routes
75
          if (itm.routes) {
76
77
            arr.push(...itm.routes);
78
          }
79
        }
80
        return null;
81
82
      }; 黄浩扬<sup>24</sup>
83
       return recur(tmp);
84
    <sup>4</sup>};
85
```

2. 在 NodeJS 环境,不需要担心同步阻塞代码的情况,有很多方式能够获取目录结构。这边的一个小场景,是通过获取 monorepo 中所有子模块包名,结合 commitizen ,对 git commit scope 做一个约束,用于 ci/cd 集成。

```
1 // get-packages.js
2 const path = require('path');
```

```
const globby = require('globby');
     const loadJsonFile = require('load-json-file');
 5
    // 获取所有子模块 package.json
     const getPackages = () => {
 7
       const allPackageJson = globby.sync(
 9
         `${path.resolve(__dirname, '../')}/components/*/package.json`,
10
       );
       return allPackageJson.map(loadJsonFile.sync);
11
12
    };
13
     const allPackages = getPackages();
14
15
     const packageNames = allPackages.map(v => v.name.replace(/@arco-s\//, ''));
16
17
18
    module.exports = {
19
       allPackages,
20
       packageNames,
    };
21
```

前端组件做结构封装,hooks做逻辑封装

B段系统列表页是一个主要的页面结构,对搜索区和表格的逻辑封装在 hooks 里,减少重复编码,更好维护

```
import { useState, useEffect, useCallback, useRef } from 'react';
 1
 2
     import {
      PaginationProps,
 3
      Message,
      FormInstance,
 5
      Notification,
 7
    } from '@arco-design/web-react';
     import { useRequest, useStateRealtime } from '@byted/hooks';
9
     import { QueryFilterProps } from '@s_op/components/src/queryFilter/index.modules';
     import { DEFAULT_SIZE_OPTIONS, DEFAULT_PAGE_SIZE } from '@/constants';
10
     import { PaginationInfo } from '@/api/common/common';
11
12
     import { trimFormData } from '@/utils/form';
     import { BaseResp } from '@/bff/product/namespaces/base';
13
14
15
     interface IPage {
16
       pagination_info: {
17
         page_no: number;
18
         page_size: number;
19
    μ6 };
20
21
22
     type IRowKey = string | number;
23
     export interface ISearchList<Req, TableItem> {
24
25
       // rowKey
26
       rowKey: string;
       // 页面初始化,一般是请求预设数据接口
27
       init?: () => Promise<void>;
28
       // 处理请求参数,一般处理时间窗参数
29
30
       reqParamsFormat?: (params: Partial<Req>) => Req;
       // 搜索列表
31
       searchList: (params: Partial<Req & IPage>) => Promise<{</pre>
32
33
         paginationInfo?: PaginationInfo;
         list: TableItem[];
34
35
       } | null>;
       // downloadType?: any;
36
```

```
// downloadKey?: keyof Req; // 导出请求字段
37
       ready?: boolean; // ready 实现按需触发,是否初始化就查询,默认是
38
       selectCrossPage?: boolean; // 是否开启表格跨页选择
39
       defaultReqData?: Partial<Req>;
40
       exportRequest?: () => Promise<{ base_resp?: BaseResp }>;
41
42
43
     /* eslint-disable max-statements */
44
45
     const useSearchList = <</pre>
       Req extends IObject = IObject,
46
       TableItem extends IObject = IObject,
47
48
     >({
49
       rowKey,
50
       init,
       reqParamsFormat,
51
52
       searchList,
53
       // downloadType,
       // downloadKey,
54
55
       ready = true,
       selectCrossPage = true,
56
57
       defaultReqData = {},
58
       exportRequest,
     }: ISearchList<Req, TableItem>) => {
59
       type IReq = Req & IPage;
60
61
       // searchForm ref
62
       // const formRef = useRef<FormInstance<Req>>(null);
63
       const formRef = useRef<FormInstance>(null);
64
65
       formRef.current?.setFields(defaultReqData);
66
       // 翻页参数
67
       const [pagination, setPagination] = useState<PaginationProps>({
68
69
         sizeOptions: DEFAULT_SIZE_OPTIONS,
         total: 0,
70
71
         current: 1,
72
         pageSize: DEFAULT_PAGE_SIZE,
73
         size: 'small',
         onChange: (pageNum, pageSize) => {
74
75
           setPagination(cur => ({
76
             ...cur,
77
             current: pageNum,
78
             pageSize,
79
          }));
80
        },
       });

```

利用继承减少重复编码但保留个体特性(多态)

1. NodeJS 中对 mysql 的 crud 操作都是类似的,因此可以很好利用这一点

```
// base.ts
 1
 2
     import { HttpContext } from '@gulu/application-http';
     import {
 3
       // Model,
 4
       ModelStatic,
       CreationAttributes,
 6
 7
       CreateOptions,
 8
       Attributes,
 9
       UpdateOptions,
10
       FindAndCountOptions,
11
       FindOptions,
12
       DestroyOptions,
13
       UpsertOptions,
14
       CountOptions,
     } from '@gulu/sequelize';
15
     // 不使用这个类型会报错
16
17
     import { Model } from '@byted-service/sequelize-creator/node_modules/sequelize-typescript';
     import BaseService from '../base';
18
     import { TimestampsModel } from '.../.../util/base/model';
19
20
     export default abstract class Base<
21
```

```
22
       P extends IObject,
       C extends IObject = P,
23
24
       M extends Model = Model<P, C>
    > extends BaseService {
25
26
       protected LOG_PREFIX = '[mysql]';
27
       private model: ModelStatic<M>;
       private timestamps: boolean;
28
29
30
       constructor(ctx: HttpContext, model: ModelStatic<M>) {
31
         super(ctx);
32
         this.model = model;
33
34
         this.timestamps = TimestampsModel.isPrototypeOf(model);
35
36
37
       get repo() {
         return this.ctx.sequelize.getRepository(this.model);
38
39
40
       async create(params: CreationAttributes<M>>, options?: CreateOptions<Attributes<M>>) {
41
42
         const tmp = Object.create(null);
         if (this.timestamps) {
43
           const now = Date.now().valueOf();
44
           tmp.createTime = now;
45
           tmp.updateTime = now;
46
47
         const res = await this.repo.create({ ...tmp, ...params }, options);
48
49
         return res?.dataValues as P;
50
51
52
       async update(params: { [key in keyof Attributes<M>]?: Attributes<M>[key] }, options:
53
     UpdateOptions<Attributes<M>>) {}
54
       async findOne(options?: FindOptions<Attributes<M>>) {}
55
56
       async findAll(options?: FindOptions<Attributes<M>>) {}
57
58
       async delete(options: DestroyOptions<Attributes<M>>) {}
59
60
61
       async deleteOneByID(value: number | string, key = 'id') {}
62
       async upsert(params: CreationAttributes<M>, options?: UpsertOptions<Attributes<M>>) {}
63
64
       async count(options?: Omit<CountOptions<Attributes<M>>, 'group'>) {}
65
66
67
```

```
// picture.ts
    import { HttpContext } from '@gulu/application-http';
    import { Op } from '@gulu/sequelize';
    import PictureModel, { TAttributes, CAttributes } from '../../model/picture';
 4
 5
     import Base from './base';
 6
7
    class Picture extends Base<TAttributes, CAttributes> {
8
      LOG_PREFIX = '[mysql/Picture]';
9
10
      constructor(ctx: HttpContext) {
        super(ctx, PictureModel);
11
```

```
12
13
      async hasUri(uriList: string[]) {
14
15
        const count = await this.count({
16
          where: {
17
            uri: {
              [Op.in]: uriList,
18
         },
19
20
          },
21
        });
22
        return count > 0;
23
24
25
    export default Picture;
26
27
```

接口服务合理利用 Promise

1. 为接口提供最大返回时长,超过时长则返回已处理数据

```
1 const sleep = (timeout: number) =>
       new Promise(resolve => {
 2
         setTimeout(resolve, timeout);
 3
 4
      });
     type AnyFuncion = (...args: any[]) => any;
 6
     class Sleep {
 7
       callbacks: AnyFuncion[];
       timeout: number;
 9
10
       constructor(timeout: number) {
11
         this.callbacks = [];
12
         this.timeout = timeout;
13
14
15
         this.run(); 3446
16
17
       subscript(callback: AnyFuncion) {
18
         if (typeof callback === 'function') {
           this.callbacks.push(callback);
19
20
         } 病海肠 244
21
22
       notify() {
         this.callbacks.forEach(callback => {
23
24
         callback();
25
         });
26
       async run() {
27
28
         await sleep(this.timeout);
         this.notify();
29
30
31
32
33
     const onTime = function <T>(promises: Promise<T>[], timeout: number): Promise<(T | undefined)[]> {
       return new Promise(resolve => {
34
35
         const result: (T | undefined)[] = Array(promises.length);
36
         promises.forEach(async (promise, index) => {
37
           const res = await promise;
38
           result[index] = res;
39
```

```
40
41
           if (result.length >= promises.length) {
42
             resolve(result);
43
44
         });
45
         new Sleep(timeout).subscript(() => {
46
          resolve(result);
47
48
         });
49
       });
50
     };
51
52
     export default onTime;
```

2. 定时任务,对大批量操作实行分批处理

```
import { HttpApplication } from '@gulu/application-http';
 1
    import schedule from 'node-schedule';
 2
 3
    import monent from 'moment';
     import { DAY_TIMESTAMP } from '.../util/constant';
     import { Corpus } from '../extension/context';
 5
     import { TAttributes as TPictureCache } from '../model/picture_cache';
 6
     import { TAttributes as TUriRelation } from '../model/uri_relation';
 7
8
     import chunk from 'lodash/chunk';
9
     type DBItem = TPictureCache & TUriRelation;
10
11
     // 定时任务,凌晨2点刷新近7日图片查重信息
12
13
    export const fetchPictureMatchInfoOn2am = async (app: HttpApplication) => {
      const LOG_PREFIX = '[Schedule]';
14
15
      const DAY_FORMAT = 'YYYY-MM-DD';
      const SEVEN_DAYS_TIMESTAMP = 7 * DAY_TIMESTAMP;
16
      const ctx = app.mockContext();
17
18
      const {
19
        logger,
20
        service: { mysql, picture, redis },
21
        sequelize,
      } = ctx;
22
23
       const rule = new schedule.RecurrenceRule();
24
       rule.tz = 'PRC'; // 时区,默认为中国时区,后续如果多国家需要重新适配为用户所在地
25
       rule.hour = 2;
26
       rule.minute = 0;
27
28
       // rule.second = 0;
29
      schedule.scheduleJob(rule, async () => {
30
        logger.info(`${LOG_PREFIX} - Batch fetch picture match info on 2:00am`);
31
32
33
        const now = monent();
         const redisKey = `${LOG_PREFIX}-${now.format(DAY_FORMAT)}`;
34
35
         const unlocked = await redis.base.setLock(redisKey);
         // 通过 redis 锁,避免 nodejs 多实例执行多次轮询
36
37
         if (!unlocked) {
38
          logger.info(`${LOG_PREFIX} - redis lock ${redisKey} existed, stop the cron job`);
39
40
        }
41
         const [rows] = (await sequelize.query(
42
43
           `SELECT * from picture_cache LEFT JOIN uri_relation ON picture_cache.source = uri_relation.uri
     AND picture_cache.create_time > ${
```

```
now.valueOf() - SEVEN_DAYS_TIMESTAMP
44
45
         )) as [DBItem[], any];
46
47
48
         const unit = async ({ source, code, codeType, corpusName, extraInfo }: DBItem) => {
           let parseExtraInfo: Record<string, any> = {};
49
50
           try {
            parseExtraInfo = JSON.parse(extraInfo) ?? {};
51
52
           } catch (err) {
             parseExtraInfo = {};
53
54
           }
           await picture.getOneMatchInfo({
55
56
             uri: source,
             code,
57
            codeType,
58
59
             corpus: corpusName?.includes('hotselling') ? Corpus.HOTSELLING : Corpus.DEFAULT,
60
             isTest: corpusName?.includes('test'),
             url: parseExtraInfo.url,
61
           });
62
63
         };
64
         // 50条为一批串行执行,降低db负载
65
         await chunk(rows, 50).reduce(
66
           async (res, arr) =>
67
68
             res.then(async () => {
               await Promise.all(arr.map(unit));
69
70
             }),
           Promise.resolve()
71
72
         );
73
       });
74
       // 防止node宕机容错
75
       process.on('SIGINT', async () => {
76
77
         logger.error(`${LOG_PREFIX} - Gracefully shutdown`);
78
         await schedule.gracefulShutdown();
79
         process.exit(0);
80
       });
81
    <sup>2</sup>};
82
```

团队

• 参与 S 项目外包招聘,大概面试了50个人
